ABSTRACTED-PUB-NO: DE 29604717U

BASIC-ABSTRACT: The operating console has a single operating knob which can be depressed axially and pivoted in 4 different directions and an associated switch lever for acting as a multi-function switch. The operating function is selected using a microprocessor and a selection menu indicating each of the different equipments, provided by a liquid crystal display (2) in the field of view of the driver, controlled by an on/off switch (5).

A memory button allows the selected settings for a given equipment to be stored in the microprocessor memory, with a memory call-up button for accessing the stored settings.

ADVANTAGE - Designed for simple operation during driving.

Abstract

PROBLEM TO BE SOLVED: To permit a simple, accurate blind operation for driving and controlling various electric equipment mounted on a vehicle with no hindrance given to vehicle driving.

SOLUTION: A vehicular operating device 1 comprises a display 5 to display thereon a menu indication or a control indication for selecting the drive of various electric equipment mounted on a vehicle, a joystick 3 to select and determine a desired mode in the menu indication, and a controller 2 to change over the menu indication and determine a selected mode based on a selection signal V1 and a determination signal V2 supplied from the joystick 3. The joystick 3 is thus blindly operated through the watching of the display 5.
